

## Heavy Rescue (also place in HazMat and Air/Light)

Model DF1182R Hazmat

### Indiana County Emergency Management Agency

Indiana, PA

Indiana County EMA, located just east of Pittsburg in western Pennsylvania, provides hazmat response capabilities for Indiana County and regional state responses. To maximize its capability of transporting all hazmat response and mitigation equipment in a single vehicle, they chose a Hackney 11-compartment hazmat body with recessed roof compartments. The body boasts a huge 900 cu.ft. of storage capacity, plus three roof mounted coffin compartments.

The body is mounted on an International 4400 with 330 hp engine and vertical exhaust. A 40,000 watt, 3-phase PTO generator, mounted in the left front compartment to protect it from corrosive PA road salt spray, provides power for a 26.5 cfm breathing air compressor with 20 hp electric motor, NightScan light tower recessed on the roof and four 900-watt upper side body MagnaFire flood lights.

The cast-iron block Ingersoll compressor operates at a quiet 1000 rpm's. A Scott RevolveAir two-bottle fill station can fill automatically through the microprocessor controlled sequencer or manually through the integrated cascade control panel.

All emergency lights, tail lights, clearance lights, compartment lights and rear traffic advisor light bar are LED for low maintenance and amperage draw. The electrical system is full multiplexed with color VISTA LCD control panel on the console.

*A 26.5 cfm breathing air compressor and RevolveAir fill station provides on-scene air support operations. Not cavernous storage compartments for hazmat equipment.*
